THE HOSPITAL PERFORMANCE ASSESSMENT BY PABON LASSO

MD Alina Breazu, National Institute for Health Services Management,
Bucharest, Romania

5 – 7 June 2024 – Bucharest, Romania

Politehnica University of Bucharest, Bucharest, Romania

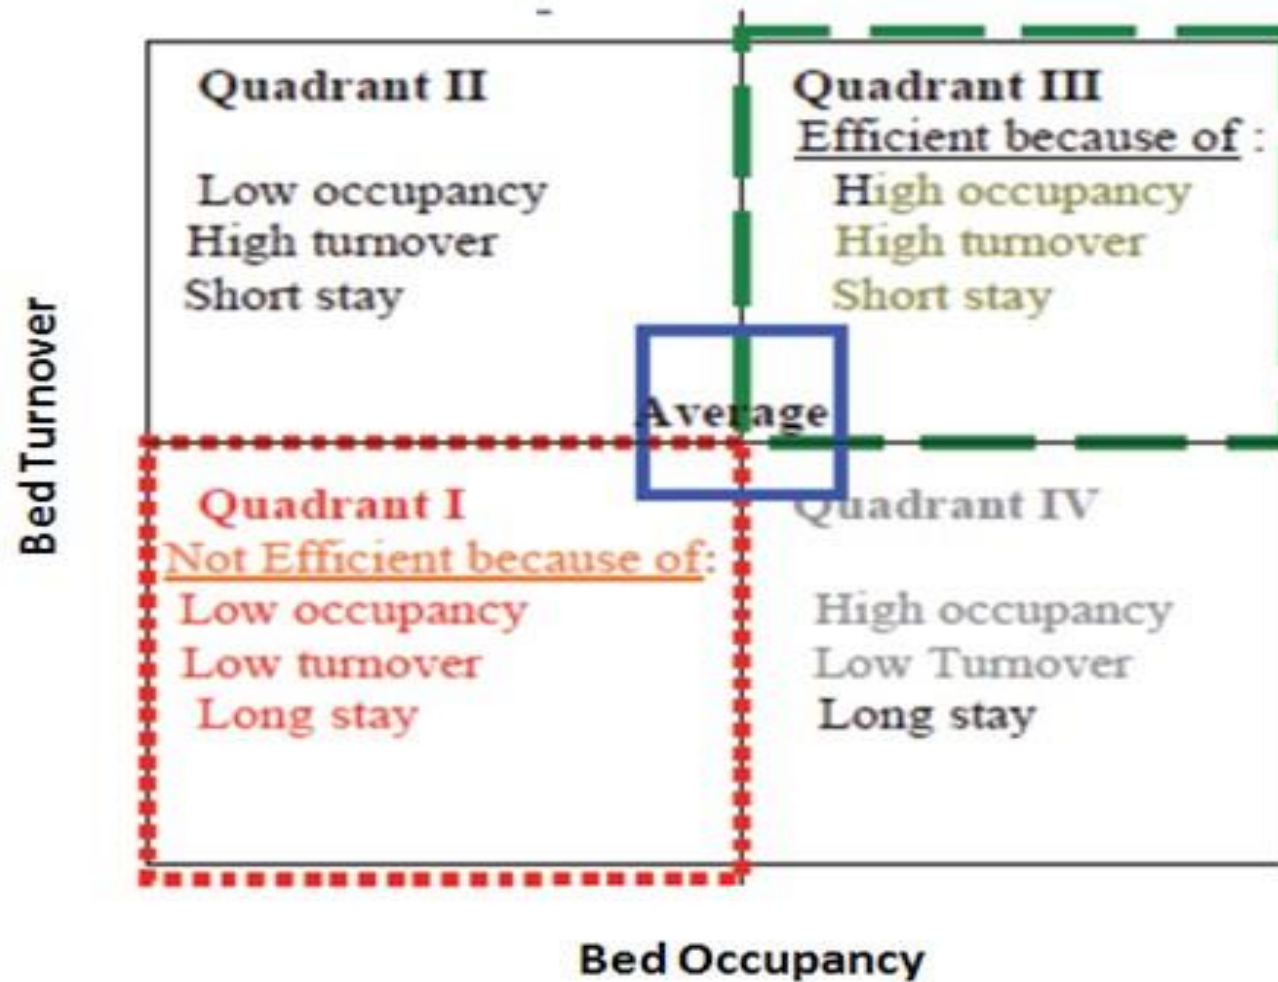

#EHMA2024

Background and objectives

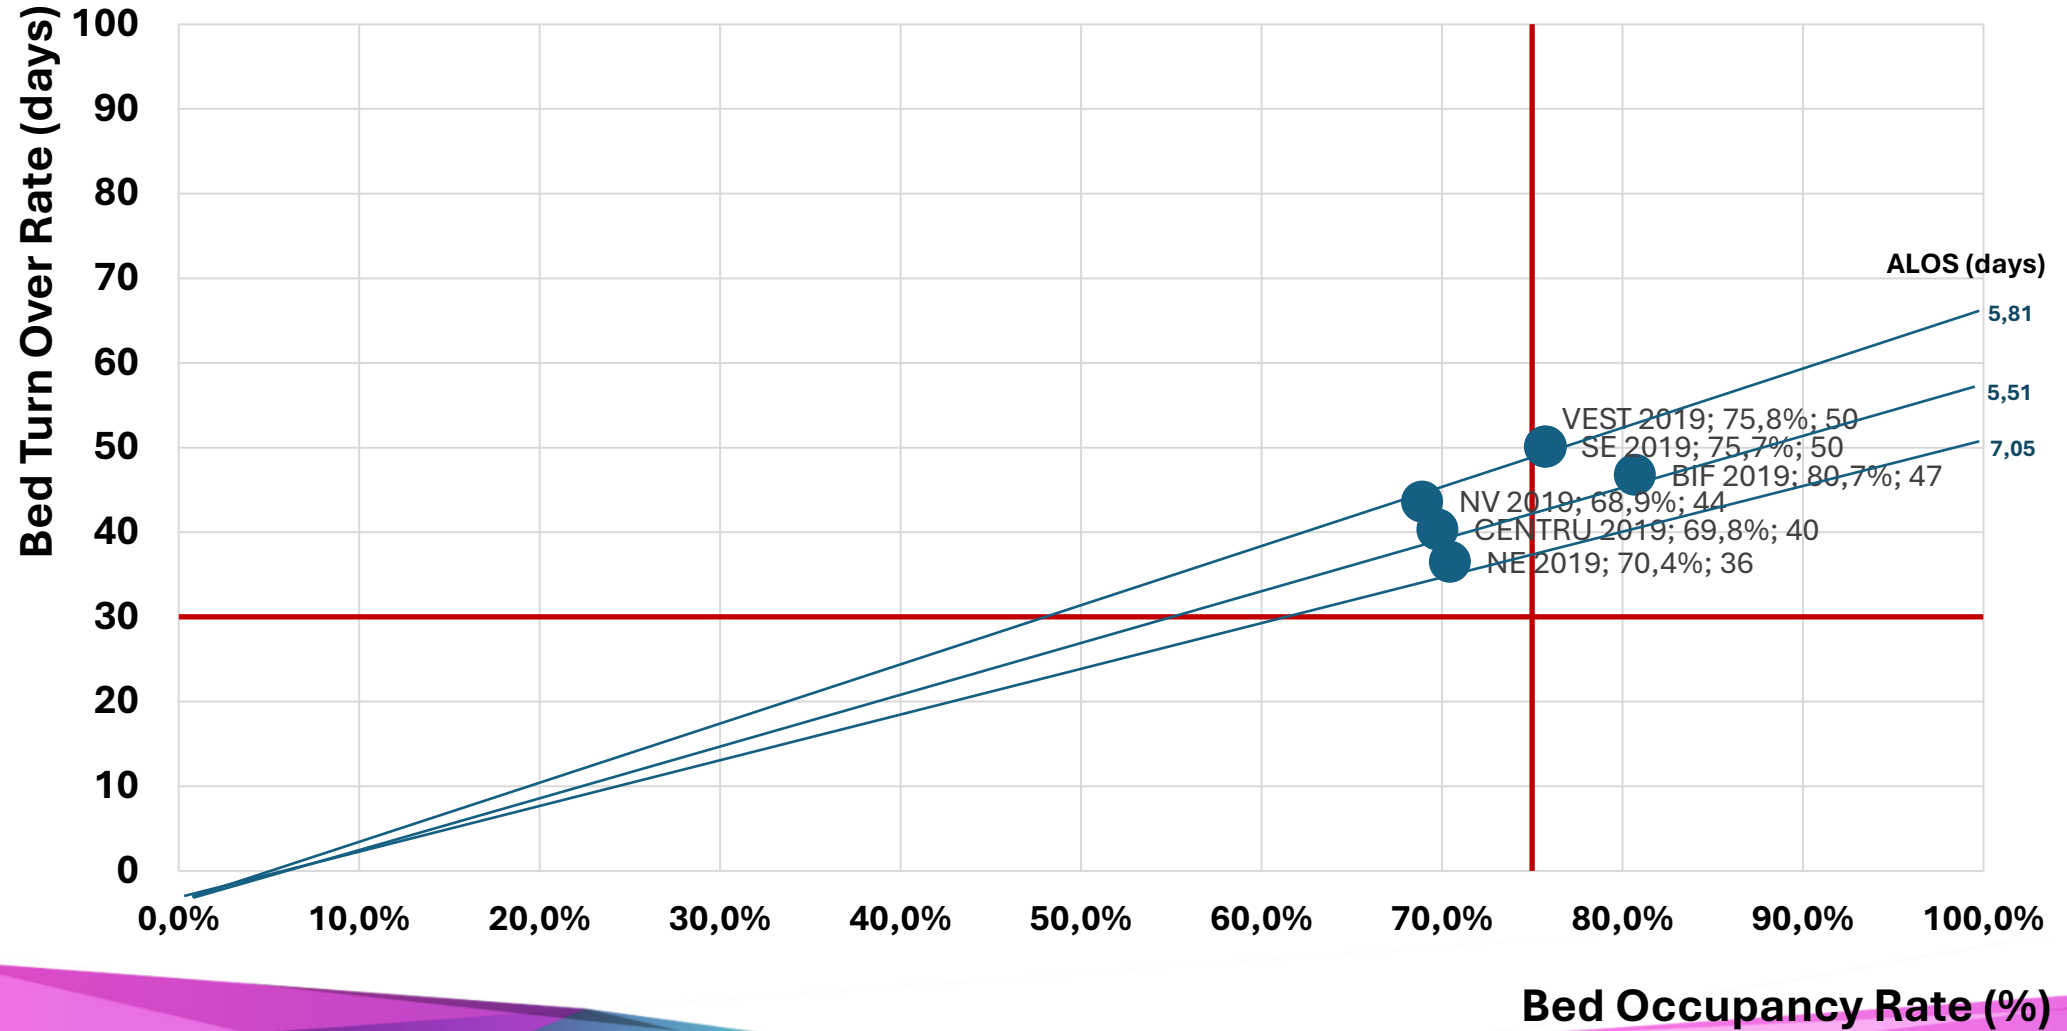

- Hospital sector is the most resource consuming part of a health system (50%);
- We selected only hospitals category I and I-M from six regions; Pabon Lasso model is used for decision makers (both hospital management and political decisions)

Methods

- The DRG National database was used for extracting data reported by hospitals
- Only hospitals with surgical departments were included
- Three classical hospital performance indicators (average length of stay, bed occupancy rate and bed turnover)
- The statistical software SPSS 27 and EXCEL was used for analysis

Pabon Lasso Model – year 2019

Pabon Lasso Model – year 2023

Discussions

- By applying the Pabon Lasso Model and the comparative analysis between regions in the Romanian context and at the level of surgical departments, we signal the necessity to use developed and validated methods for measuring and comparing hospital performance in order to provide decision making process with valid and scientific evidence.
- The performance of Romanian hospitals is evaluated by a wider grid of indicators, but the use of these 3 complex indicators is essential for a quick and correct evaluation picture. That is why we consider it useful and necessary to extrapolate this analysis in the future to all categories of hospitals in Romania.
- This model offers complex information, so it can be used for decision making
